# Toward quantum gravity?

 $\rightarrow$  Good candidate for a quantum space underlying the description of quantum gravity, at least in some regime.

## Motivations of studying $\kappa$ -Minkowski:

- Its low energy limit  $(\kappa \to +\infty)$  is the Minkowski space.
- A  $\kappa$ -Poincaré-invariant NCFT on  $\kappa$ -Minkowski would easily satisfy Poincaré-invariance at low energies.
- κ-Poincaré realises a Doubly Special Relativity (DSR) giving a testable framework.<sup>1</sup>
- In 2+1 dimensions, an effective NCFT containing matter must be κ-Poincaré invariant.<sup>2</sup>

# Star product on $\kappa$ -Minkowski

To model a quantum version of a finite dimensional manifold  $\mathcal{M}$ , we work at the level of coordinates  $f \in \mathcal{C}^{\infty}(\mathcal{M})$  rather than points  $x \in \mathcal{M}$ . The quantum space is then a general algebra of functions  $\mathcal{A}$  with a noncommutative product  $\star$ .

# Star product on $\kappa$ -Minkowski

To model a quantum version of a finite dimensional manifold  $\mathcal{M}$ , we work at the level of coordinates  $f \in \mathcal{C}^{\infty}(\mathcal{M})$  rather than points  $x \in \mathcal{M}$ . The quantum space is then a general algebra of functions  $\mathcal{A}$  with a noncommutative product  $\star$ .

We take the star product on  $\kappa$ -Minkowski given by<sup>6</sup>

$$(f \star g)(x^{0}, \vec{x}) = \int dp_{0}dy^{0} e^{-iy^{0}p_{0}} f(x^{0} + y^{0}, \vec{x}) g(x^{0}, e^{-p_{0}/\kappa} \vec{x}),$$
$$f^{\dagger}(x^{0}, \vec{x}) = \int dp_{0}dy^{0} e^{-iy^{0}p_{0}} \overline{f}(x^{0} + y^{0}, e^{-p_{0}/\kappa} \vec{x}).$$

Hersent Kilian Workshop on Noncommutative and generalized geometry September, 22<sup>nd</sup> 2022

# Properties of the star product

## Non-cyclic trace

$$\int d^{d+1}x \ f \star g = \int d^{d+1}x \ (\mathcal{E}^{\mathbf{d}} \triangleright g) \star f$$

# Properties of the star product

### Non-cyclic trace

$$\int d^{d+1}x \ f \star g = \int d^{d+1}x \ (\mathcal{E}^{\mathbf{d}} \triangleright g) \star f$$

Gauge invariant action is not straightforward anymore:

$$S = \int \mathrm{d}^{d+1} x \; F^{\dagger} \star F$$

with F the curvature transforming as  $F^g = g^{\dagger} \star F \star g$  and  $g^{\dagger} \star g = 1$ . Then,

$$S^{g} = \int d^{d+1}x \ (F^{g})^{\dagger} \star F^{g} = \int d^{d+1}x \ g^{\dagger} \star F^{\dagger} \star g \star g^{\dagger} \star F \star g$$
$$= \int d^{d+1}x \ (\mathcal{E}^{d} \triangleright g) \star g^{\dagger} \star F^{\dagger} \star F \neq S$$

### Connection and curvature

Consider the module  $\mathbb{E} = \mathcal{M}_{\kappa}$ , with action  $m \triangleleft f = m \star f$ .

## Expression of a connection and its curvature

$$\nabla_{X_{\mu}}(f) = X_{\mu}(f) + A_{\mu} \star f$$

$$F_{\mu\nu} = X_{\mu}(A_{\nu}) - X_{\nu}(A_{\mu}) + A_{\mu} \star A_{\nu} - A_{\nu} \star A_{\mu}$$

## Connection and curvature

Consider the module  $\mathbb{E} = \mathcal{M}_{\kappa}$ , with action  $m \triangleleft f = m \star f$ .

## Expression of a connection and its curvature

$$\nabla_{X_{\mu}}(f) = X_{\mu}(f) + A_{\mu} \star f$$

$$F_{\mu\nu} = X_{\mu}(A_{\nu}) - X_{\nu}(A_{\mu}) + A_{\mu} \star A_{\nu} - A_{\nu} \star A_{\mu}$$

## Gauge transformation

$$A_{\mu}^g = g^{\dagger} \star A_{\mu} \star g + g^{\dagger} \star X_{\mu}(g) \qquad \qquad F_{\mu\nu}^g = g^{\dagger} \star F_{\mu\nu} \star g$$

## Connection and curvature

Consider the module  $\mathbb{E} = \mathcal{M}_{\kappa}$ , with action  $m \triangleleft f = m \star f$ .

## Expression of a connection and its curvature

$$\nabla_{X_{\mu}}(f) = X_{\mu}(f) + A_{\mu} \star f$$

$$F_{\mu\nu} = X_{\mu}(A_{\nu}) - X_{\nu}(A_{\mu}) + A_{\mu} \star A_{\nu} - A_{\nu} \star A_{\mu}$$

## Gauge transformation

$$A^g_{\mu} = g^{\dagger} \star A_{\mu} \star g + g^{\dagger} \star X_{\mu}(g)$$

$$F^g_{\mu\nu} = g^\dagger \star F_{\mu\nu} \star g$$

## Unitary gauge group

$$\mathcal{U}(1) = \left\{ g \in \mathbb{E}^{\times}, g^{\dagger} \star g = g \star g^{\dagger} = 1 \right\}.$$

### Twisted connection and curvature

Consider the module  $\mathbb{E} = \mathcal{M}_{\kappa}$ , with action  $m \triangleleft f = m \star f$ .

## Expression of a twisted connection and its curvature

$$\nabla_{X_{\mu}}(f) = X_{\mu}(f) + A_{\mu} \star f$$

$$F_{\mu\nu} = X_{\mu}(A_{\nu}) - X_{\nu}(A_{\mu}) + (\mathcal{E} \triangleright A_{\mu}) \star A_{\nu} - (\mathcal{E} \triangleright A_{\nu}) \star A_{\mu}$$

### Twisted connection and curvature

Consider the module  $\mathbb{E} = \mathcal{M}_{\kappa}$ , with action  $m \triangleleft f = m \star f$ .

## Expression of a twisted connection and its curvature

$$\nabla_{X_{\mu}}(f) = X_{\mu}(f) + A_{\mu} \star f$$

$$F_{\mu\nu} = X_{\mu}(A_{\nu}) - X_{\nu}(A_{\mu}) + (\mathcal{E} \triangleright A_{\mu}) \star A_{\nu} - (\mathcal{E} \triangleright A_{\nu}) \star A_{\mu}$$

## Twisted gauge transformation

$$A^g_{\mu} = (\mathcal{E} \triangleright g^{\dagger}) \star A_{\mu} \star g + (\mathcal{E} \triangleright g^{\dagger}) \star X_{\mu}(g) \quad F^g_{\mu\nu} = (\mathcal{E}^2 \triangleright g^{\dagger}) \star F_{\mu\nu} \star g$$

## Twisted connection and curvature

Consider the module  $\mathbb{E} = \mathcal{M}_{\kappa}$ , with action  $m \triangleleft f = m \star f$ .

## Expression of a twisted connection and its curvature

$$\nabla_{X_{\mu}}(f) = X_{\mu}(f) + A_{\mu} \star f$$

$$F_{\mu\nu} = X_{\mu}(A_{\nu}) - X_{\nu}(A_{\mu}) + (\mathcal{E} \triangleright A_{\mu}) \star A_{\nu} - (\mathcal{E} \triangleright A_{\nu}) \star A_{\mu}$$

## Twisted gauge transformation

$$A_{\mu}^g = (\mathcal{E} \triangleright g^{\dagger}) \star A_{\mu} \star g + (\mathcal{E} \triangleright g^{\dagger}) \star X_{\mu}(g) \quad F_{\mu\nu}^g = (\mathcal{E}^2 \triangleright g^{\dagger}) \star F_{\mu\nu} \star g$$

## Unitary gauge group

$$\mathcal{U}(1) = \{ g \in \mathbb{E}^{\times}, g^{\dagger} \star g = g \star g^{\dagger} = 1 \}.$$

# The gauge invariant action

## Noncommutative $\mathcal{U}(1)$ -Yang-Mills-like action

$$S = \int \mathrm{d}^5 x \; F \star F^{\dagger}$$

which requires that the space-time dimension is 5.

This action satisfies the following properties:

- 1.  $\kappa$ -Poincaré invariance,
- 2. Gauge invariance under the unitary gauge group  $\mathcal{U}(1)$ ,
- 3. The commutative limit  $\kappa \to +\infty$  coincide with standard Abelian gauge theory (in (d+1)-dimensional Minkowski space).

## Table of Contents

- $exttt{1}$  The  $\kappa$ -Minkowski space-time
  - $\bullet$  The  $\kappa$ -Poincaré algebra
  - From the symmetries to the space-time
- 2 Star product structure on  $\kappa$ -Minkowski
- - The twisted derivations
  - Twisted gauge potential and its field strength
  - The gauge invariant action
- The one-loop tadpole computation

# Non-vanishing tadpole

At first, we assume that A is real-valued, i.e.  $\overline{A} = A$ .

$$S = \int K^{\mu\nu} A_{\mu} A_{\nu} + V^{\mu\nu\rho}_{(3)} A_{\mu} A_{\nu} A_{\rho} + V^{\mu\nu\rho\sigma}_{(4)} A_{\mu} A_{\nu} A_{\rho} A_{\sigma}$$

We use the Fadeev-Popov procedure with BRST gauge fixing.

Deformed Lorenz gauge 
$$X^{\mu}A_{\mu} = 0$$
,

$$= \int d^5 x \, \mathcal{I}(\kappa) A_0(x).$$

Parametrized temporal gauge  $A_0 = \lambda$ .

$$= \Gamma_1^{\mathrm{gh}}(A_0) + \lambda \int \mathrm{d}^5 x \ \mathcal{J}(\kappa) A_0(x).$$

# Comments on the tadpole

$$\qquad = \begin{cases} \int d^5 x \, \mathcal{I}(\kappa) A_0(x) & (X^{\mu} A_{\mu} = 0) \\ \Gamma_1^{\text{gh}}(A_0) + \lambda \int d^5 x \, \mathcal{J}(\kappa) A_0(x) & (A_0 = \lambda) \end{cases}$$

#### Comments:

Hersent Kilian

- Good commutative limit: the tadpole vanish when  $\kappa \to +\infty$ .
- The tapole is still non-vanishing when relaxing  $\overline{A} = A$ .
- If matter is added, it does not contribute.
- Non-vanishing tadpole has already been encountered in other quantum spaces like for massless gauge theory<sup>7</sup> on  $\mathbb{R}^3_{\lambda}$  or for matrix gauge theory on the Moyal plane<sup>8</sup>  $\mathbb{R}^2_{\theta}$ .
- The gauge (BRST) symmetry is broken.
- The temporal gauge  $A_0 = 0$  is recovered taking  $\lambda \to 0$ . Doing so the ghosts decouples  $\Gamma_1^{\text{gh}}(A_0) = 0$  and the tadpole vanish.

### The new vacuum

The vacuum expectation value of the gauge potential is non-vanishing:  $\langle A_{\mu} \rangle \neq 0.$ 

The classical vacuum is unstable against quantum fluctuations (through linear term in  $A_{\mu}$ ).

The theory is expended around a new vacuum  $A_{\mu} = \langle A_{\mu} \rangle + \alpha_{\mu}$ , with a new field variable  $\alpha_{\mu}$ , through 1-loop renormalization.

Thanks for your attention!
