

# Recent highlights from LHCb

## Neville Harnew University of Oxford

On behalf of the LHCb Collaboration

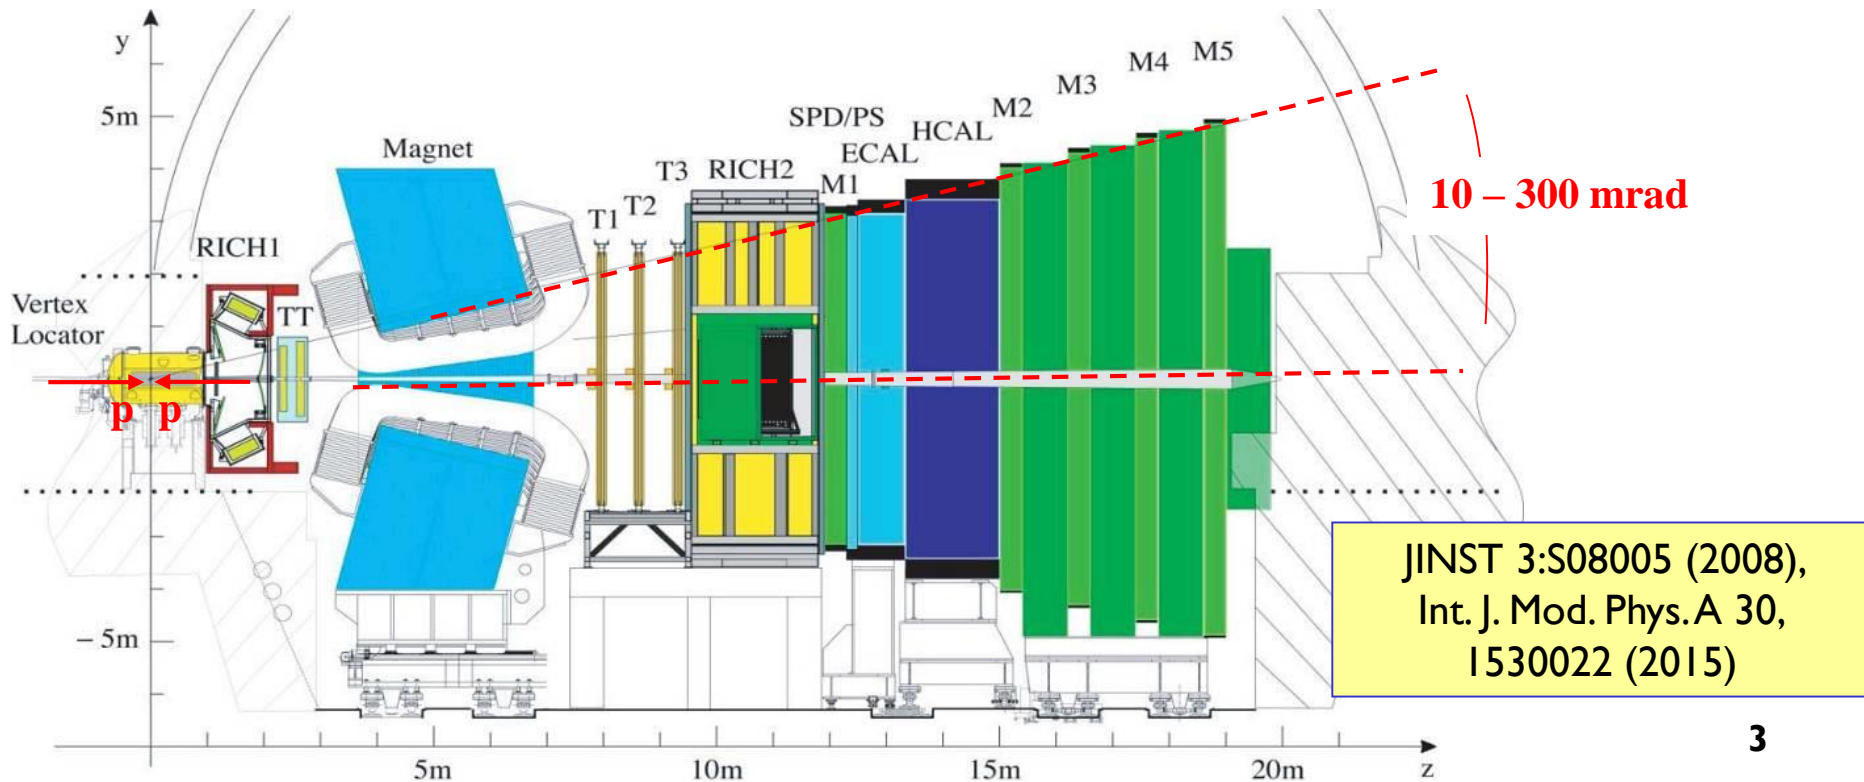

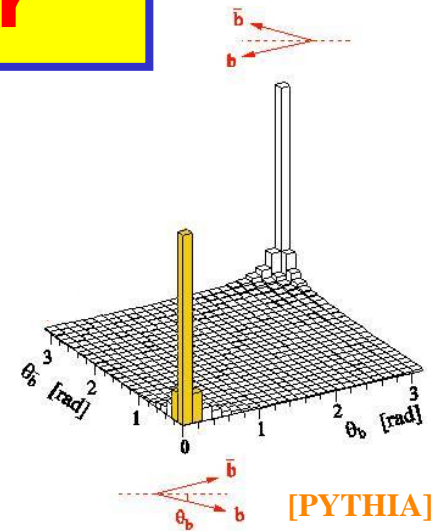

Corfu Summer  
Institute  
31 August 2022

# Outline

- General introduction to LHCb
- An update of mixing and CP-violation measurements
  - Unitarity triangle and update on the angle  $\gamma$
  - Mixing and CP violation in charm
- New measurements in spectroscopy
- Rare decays and anomalies
  - Lepton universality
- The upgraded LHCb detector and outlook
- Summary

# LHCb forward spectrometer

- Forward-peaked production → LHCb is a forward spectrometer (operating in LHC collider mode)
  - $b\bar{b}$  cross-section =  $154.3 \pm 1.5 \pm 14.3 \mu\text{b}$  at  $\sqrt{s} = 13 \text{ TeV}$  in the LHCb acceptance  $2 < \eta < 5$  PRL 118,052002 (2017)
- $O(100,000)$   $b\bar{b}$  pairs produced/second at LHC Run 1&2 luminosities ( $c\bar{c}$  x20 larger)

# LHCb data taking

- Design luminosity =  $2 \times 10^{32} \text{ cm}^{-2} \text{ s}^{-1}$  (50 times less than ATLAS/CMS). Typical running luminosity  $\sim 4 \times 10^{32} \text{ cm}^{-2} \text{ s}^{-1}$

Run 1 & 2  
 $\mathcal{L}_{\text{int}} = 9 \text{ fb}^{-1}$

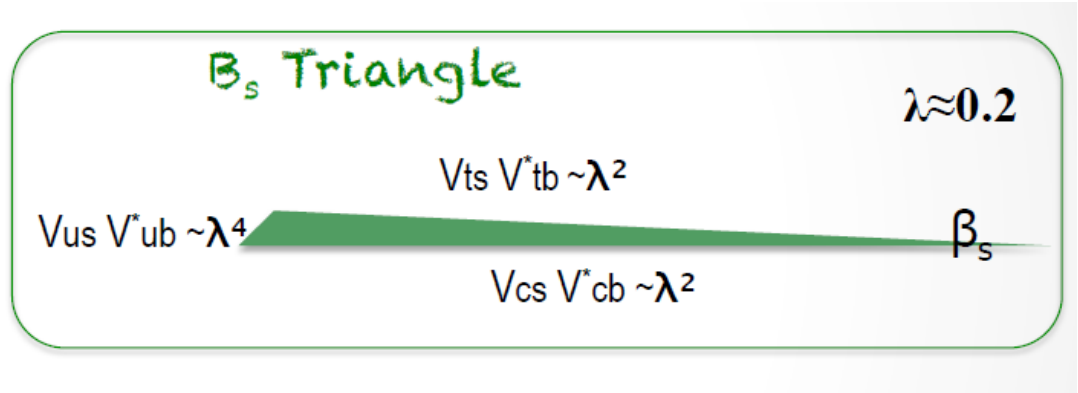

# **CP-violation and mixing in beauty and charm**

# Unitarity triangles

$$\begin{pmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & V_{cb} \\ V_{td} & V_{ts} & V_{tb} \end{pmatrix} = \begin{pmatrix} 1 - \lambda^2/2 & \lambda & A\lambda^3(\rho - i\eta) \\ -\lambda & 1 - \lambda^2/2 & A\lambda^2 \\ A\lambda^3(1 - \rho - i\eta) & -A\lambda^2 & 1 \end{pmatrix} + O(\lambda^4)$$

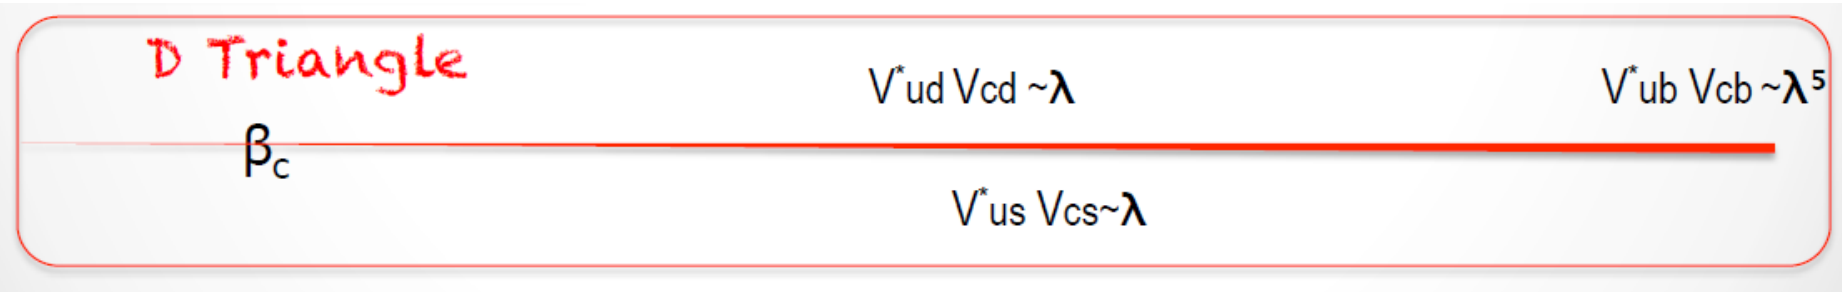

## Beauty system

B system : angles  $\alpha, \beta, \gamma \sim 1$

B<sub>s</sub> system : angle  $\beta_s \sim \lambda^2$

## Charm system

Charm system : angle  $\beta_c \sim \lambda^4$

Diagrams from Jolanta Brodzicka

# Unitarity Triangle measurements

1995

- Amazing progress in the last 27 years; the SM remains intact, but a whole lot still to learn

<http://ckmfitter.in2p3.fr>

2004

Now (dominated by LHCb)

# The angle $\gamma$ (a key measurement)

- Loop processes are very sensitive to the presence of New Physics
- Constraints on the triangle apex largely come from **loop** decay measurements
- Large uncertainty on  $\gamma$ , the only angle accessible at **tree** level : **forms a SM benchmark** (assuming no significant New Physics in tree decays)
- $\gamma$  prediction in SM theoretically very clean JHEP 01 (2014) 051, PRD 92(3):033002 (2015)
- Determination from CKM fit **excluding** all direct measurements of  $\gamma$ 

$$\gamma = (65.5^{+1.1}_{-2.7})^\circ$$
- Reaching degree level precision on  $\gamma$  is crucial

$$\gamma \equiv \arg \left[ -\frac{V_{ud}V_{ub}^*}{V_{cd}V_{cb}^*} \right]$$

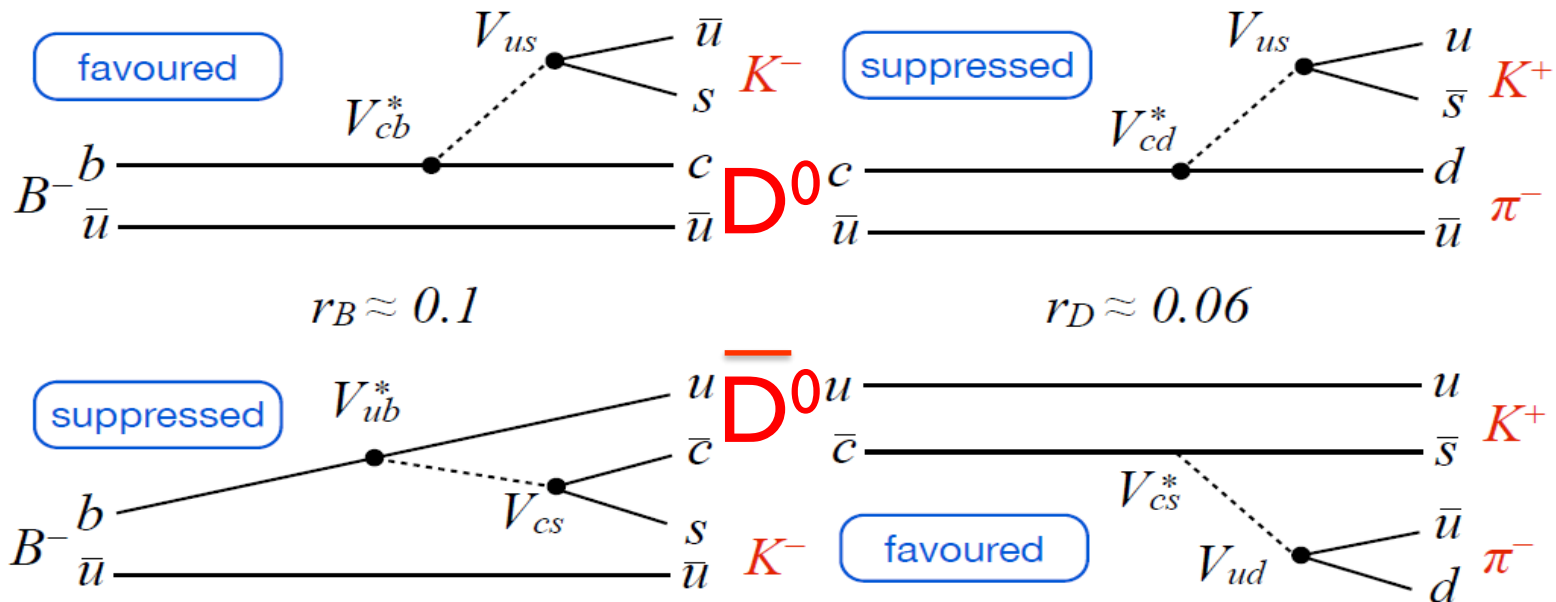

# The time-integrated mode: $B^- \rightarrow D^0 K^-$

$$\gamma \equiv \arg \left[ -\frac{V_{ud}V_{ub}^*}{V_{cd}V_{cb}^*} \right]$$

(and charge conjugate mode  $B^+ \rightarrow \bar{D}^0 K^+$ )  
provides most precise measurement of  $\gamma$

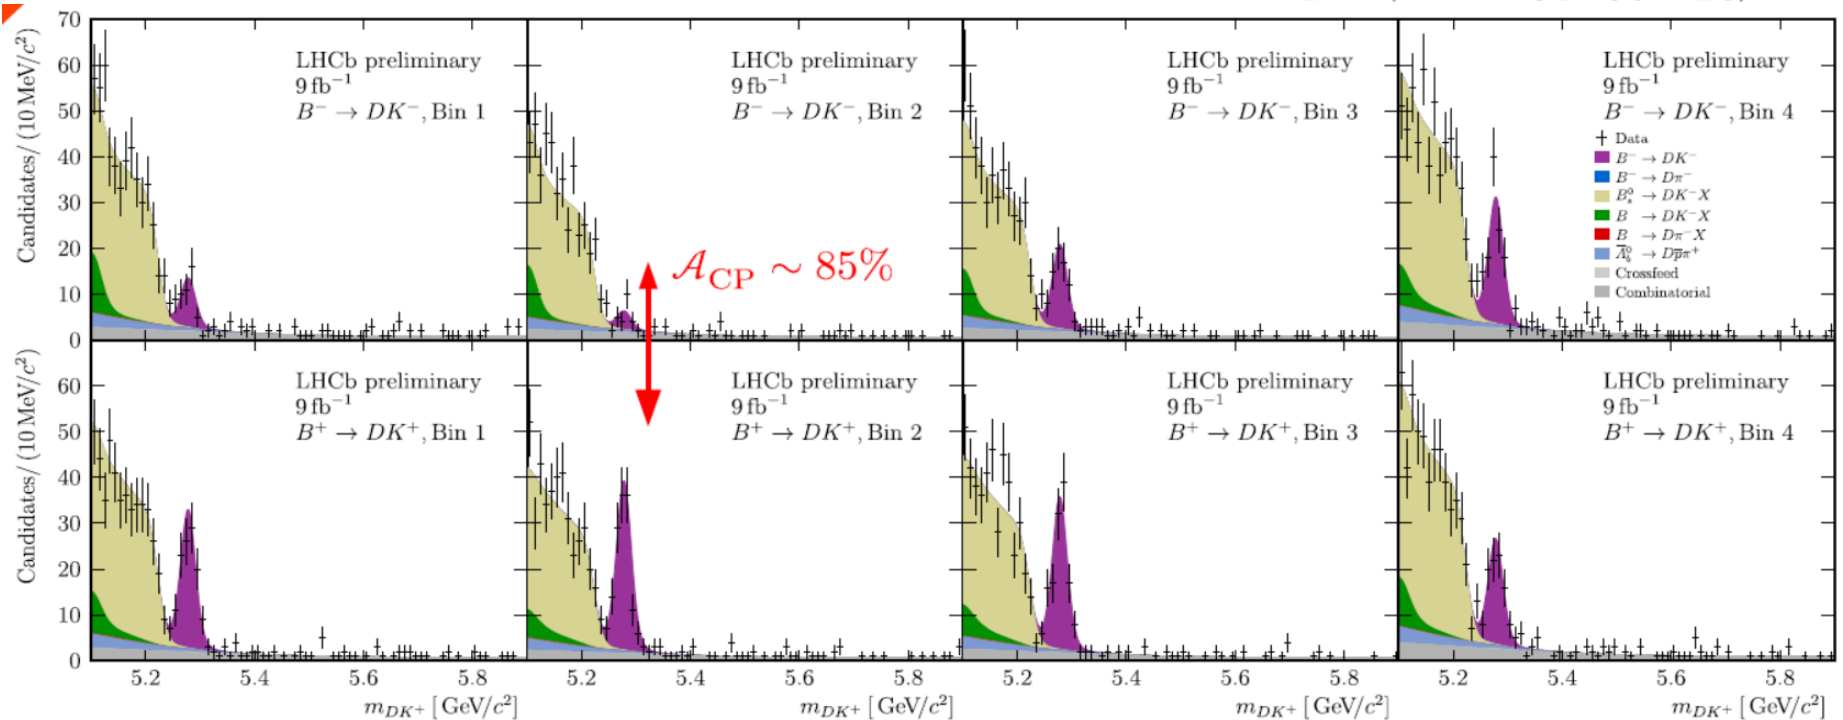

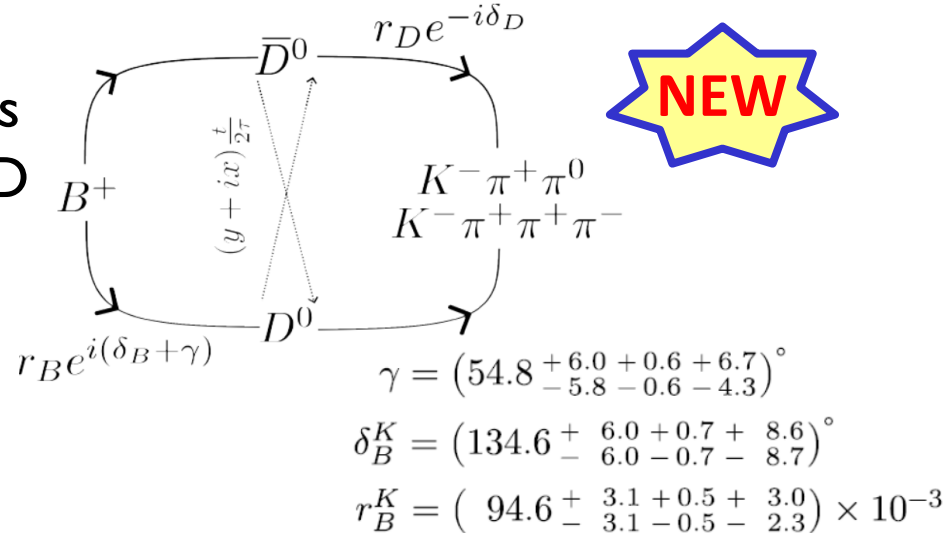

- Interference possible if  $D^0$  and  $\bar{D}^0$  decay to **same** final state
- Two possible decay paths to final state via  $D^0$  and  $\bar{D}^0$

- Branching fraction for favoured B decay only  $\sim 10^{-4}$ 
  - Measurements require high statistics

# New : $\gamma$ from $B^\pm \rightarrow D [K^-\pi^+\pi^+\pi^-] h^\pm$ decays

- Large benefits from binned analysis
- Measure observables in 4 bins of D decay phase space arXiv: 1909.10196
- Use full Run 1 and Run 2 dataset
- Largest CP violation observed

# New : $\gamma$ from $B^\pm \rightarrow D [h^\pm h' \mp \pi^0] h^\pm$ decays

arXiv:2112.10617

**NEW**

- $\pi^0$  reconstruction is challenging at LHCb
- Measure observables in 3 D decay channels

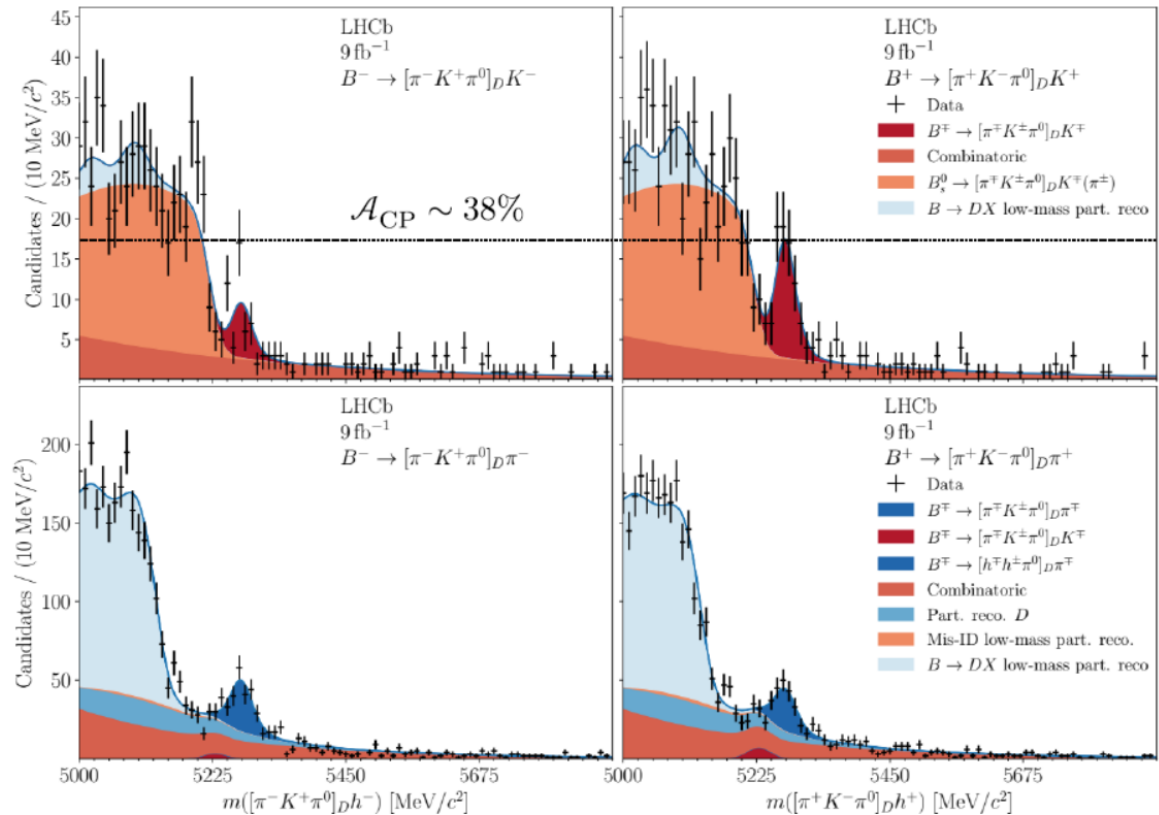

$$\begin{aligned} \gamma &= (56^{+24}_{-19})^\circ, \\ \delta_B &= (122^{+19}_{-23})^\circ, \\ r_B &= (9.3^{+1.0}_{-0.9}) \times 10^{-2} \end{aligned}$$

- $D \rightarrow K^\pm \pi^\mp \pi^0$
- $D \rightarrow \pi^+ \pi^- \pi^0$
- $D \rightarrow K^+ K^- \pi^0$

and two B decays

$B^+ \rightarrow DK^+$  &  $B^+ \rightarrow D\pi^+$

- Gives total of 11 CP violating observables
- Use full Run 1 and Run 2 dataset

# LHCb combination from different modes

JHEP 12 (2021) 141

- The most recent combination includes many decay modes :

<i>B</i> decay	<i>D</i> decay	Data set
$B^\pm \rightarrow Dh^\pm$	$D \rightarrow h^+h^-$	Run 1&2
$B^\pm \rightarrow Dh^\pm$	$D \rightarrow h^+\pi^-\pi^-\pi^+$	Run 1
$B^\pm \rightarrow Dh^\pm$	$D \rightarrow h^+h^-\pi^0$	Run 1
$B^\pm \rightarrow Dh^\pm$	$D \rightarrow K_S^0h^+h^-$	Run 1&2
$B^\pm \rightarrow Dh^\pm$	$D \rightarrow K_S^0K^\pm\pi^\mp$	Run 1&2
$B^\pm \rightarrow DK^{*\pm}$	$D \rightarrow h^+h^-$	Run 1&15/16
$B^\pm \rightarrow DK^{*\pm}$	$D \rightarrow h^+\pi^-\pi^-\pi^+$	Run 1&15/16
$B^\pm \rightarrow Dh^\pm\pi^+\pi^-$	$D \rightarrow h^+\pi^-\pi^-\pi^+$	Run 1
$B^0 \rightarrow DK^{*0}$	$D \rightarrow h^+h^-$	Run 1&15/16
$B^0 \rightarrow DK^{*0}$	$D \rightarrow h^+\pi^-\pi^-\pi^+$	Run 1&15/16
$B^0 \rightarrow DK^{*0}$	$D \rightarrow K_S^0h^+h^-$	Run 1
$B^0 \rightarrow D^\mp\pi^\pm$	$D^+ \rightarrow K^-\pi^+\pi^+$	Run 1
$B_s^0 \rightarrow D_s^\mp K^\pm$	$D_s^+ \rightarrow h^+h^-\pi^+$	Run 1
$B_s^0 \rightarrow D_s^\mp K^\pm\pi^+\pi^-$	$D_s^+ \rightarrow h^+h^-\pi^+$	Run 1&2

<i>D</i> decay	Observable(s)	Data set
$D^0 \rightarrow h^+h^-$	$\Delta A_{CP}$	Run 1&2
$D^0 \rightarrow h^+h^-$	$y_{CP}$	Run 1
$D^0 \rightarrow h^+h^-$	$\Delta Y$	Run 1&2
$D^0 \rightarrow K^+\pi^-$ (Single Tag)	$R^\pm, (x'^\pm)^2, y'^\pm$	Run 1
$D^0 \rightarrow K^+\pi^-$ (Double Tag)	$R^\pm, (x'^\pm)^2, y'^\pm$	Run 1&15/16
$D^0 \rightarrow K^\pm\pi^\mp\pi^+\pi^-$	$(x^2 + y^2)/4$	Run 1
$D^0 \rightarrow K_S^0\pi^+\pi^-$	$x, y$	Run 1
$D^0 \rightarrow K_S^0\pi^+\pi^-$	$x_{CP}, y_{CP}, \Delta x, \Delta y$	Run 1&2

# LHCb combination from the different modes

LHCb average

$$\gamma = (65.4^{+3.8}_{-4.2})^\circ$$

JHEP 12 (2021) 141

LHCb dominates world average

Reminder of indirect constraint, mainly from loops

$$\gamma = (65.5^{+1.1}_{-2.7})^\circ$$

BaBar :  $\gamma = (69^{+17}_{-16})^\circ$

PRD 87 (2013) 052015

Belle:  $\gamma = (73^{+15}_{-14})^\circ$

arXiv:1301.2033

# Breakdowns and evolution of $\gamma$ results

JHEP 12 (2021) 141

$$\gamma = (65.4^{+3.8}_{-4.2})^\circ$$

# CP violation in $B^\pm \rightarrow h^\pm h^+ h^-$

NEW

LHCb-PAPER-2021-049/050

- CPV observed in four decay channels:
  - ◆  $B^\pm \rightarrow K^\pm \pi^+ \pi^-$ ,  $B^\pm \rightarrow K^\pm K^+ K^-$
  - $B^\pm \rightarrow \pi^\pm \pi^+ \pi^-$ ,  $B^\pm \rightarrow \pi^\pm K^+ K^-$
- Large and interesting localised CP-asymmetries observed
- The biggest difference is observed for the  $B^\pm \rightarrow \pi^\pm \pi^+ \pi^-$  and  $B^\pm \rightarrow \pi^\pm K^+ K^-$  decays ( $14 \sigma$ )
- However the CP asymmetry of  $B^\pm \rightarrow K^\pm \pi^+ \pi^-$  decays compatible with zero
- Hard to know what this all means. Possible information about the relation between decay channels eg  $\pi\pi \leftrightarrow KK$  rescattering

# $B_{(s)}$ mixing at LHCb

Previous Workshop

$$\frac{N(B^0 \rightarrow B^0) - N(B^0 \rightarrow \bar{B}^0)}{N(B^0 \rightarrow B^0) + N(B^0 \rightarrow \bar{B}^0)}$$

$$\Delta m_d = (505.0 \pm 2.1 \pm 1.0) \text{ ns}^{-1}$$

Eur. Phys. J. C76 (2016) 412

Mixing measurements dominated by LHCb

—  $B_s^0 \rightarrow D_s^- \pi^+$  —  $\bar{B}_s^0 \rightarrow B_s^0 \rightarrow D_s^- \pi^+$  — Untagged

Nature Physics 18 (2022) 1

$$\Delta m_s = 17.7683 \pm 0.0051 \pm 0.0032 \text{ ps}^{-1}$$

# CP violation in charm

- Direct CP violation

Measure asymmetry

$$\left| \text{D}^0 \rightarrow f \right|^2 \neq \left| \bar{\text{D}}^0 \rightarrow \bar{f} \right|^2 \quad A(D \rightarrow f) = \frac{N(D \rightarrow f) - N(\bar{D} \rightarrow \bar{f})}{N(D \rightarrow f) + N(\bar{D} \rightarrow \bar{f})}$$

- Most promising channels are *Cabibbo-suppressed* (CS) decays where CPV may arise from the *interference* between the **tree** and the **penguin** amplitudes

- SM prediction is very small  $O(10^{-4}) \rightarrow O(10^{-3})$

# Reminder of the “ $\Delta A_{CP}$ ” measurement

- Tag  $D^0$  and  $\bar{D}^0$  via “prompt” and “semileptonic” decays:
  - ◆ Prompt: coming from primary vertex, i.e.  $D^{*+-} \rightarrow \bar{D}^0 \pi^{+-}_{soft}$
  - ◆ Semileptonic: coming from B-decays, i.e.  $B^{+-} \rightarrow \bar{D}^0 \mu^{+} X$

- The *raw* asymmetry (**A**) in Cabibbo-suppressed  $D^0 \rightarrow h^- h^+$  decays ( $h = K$  or  $\pi$ ) defined as

$$A(D \rightarrow f) = \frac{N(D \rightarrow f) - N(\bar{D} \rightarrow \bar{f})}{N(D \rightarrow f) + N(\bar{D} \rightarrow \bar{f})}$$

Phys. Rev. Lett. 122  
(2019) 211803

includes physics and detector effects:

$$A = A_{CP} + A_D + A_P$$

Detection asymmetry  
from  $\pi^{+}_{soft}$  or  $\mu^{+}$   
Production asymmetry  
from  $D^{*+}$  or B decays

- To eliminate these contributions and cancel the systematics measure :

$$\Delta A_{CP} = A(K^- K^+) - A(\pi^- \pi^+) = A_{CP}(K^- K^+) - A_{CP}(\pi^- \pi^+)$$

# Observation of CPV in charm decays

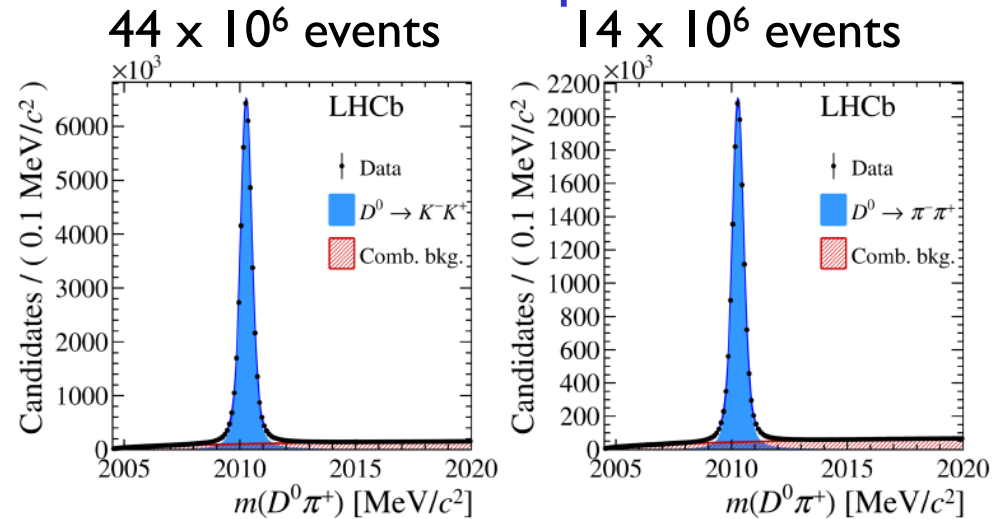

- Measurement performed with combined Run I and Run 2 data-set

Phys. Rev. Lett. 122 (2019) 211803

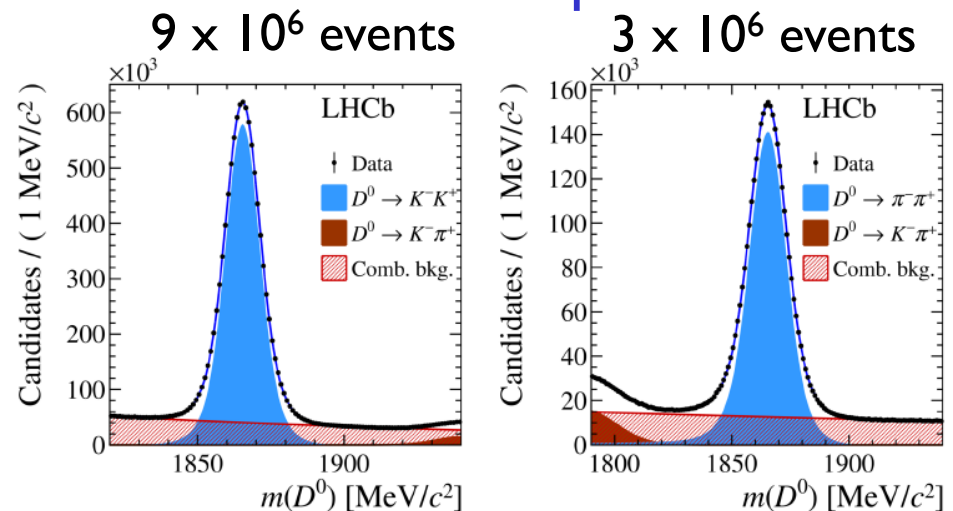

$$\Delta A_{CP} = [-15.4 \pm 2.9] \times 10^{-4}$$

- The first measurement of CPV in the charm system ( $5.3\sigma$ ) !
- However this doesn't pin down the channel which the CP violation is in

Prompt

Semi-leptonic

# CP violation in a *specific* charm hadron decay

LHCb-PAPER-2022-024 (in preparation)

**NEW**

- New measurement of  $A_{CP}(K^-K^+)$  :

$$A_{CP}(K^-K^+) = [6.8 \pm 5.4(\text{stat}) \pm 1.6(\text{syst})] \times 10^{-4}$$

then determine the direct CP asymmetries in  $\pi^- \pi^+$  from  $\Delta A_{CP}$

$$a_{K^-K^+}^d = (7.7 \pm 5.7) \times 10^{-4}$$

$$a_{\pi^- \pi^+}^d = (23.2 \pm 6.1) \times 10^{-4} *$$

- First evidence in a single channel ( $3.8\sigma$  in  $D^0 \rightarrow \pi^- \pi^+$ ) for direct CP violation ( $1.4\sigma$  in  $D^0 \rightarrow K^- K^+$ )
- Yet unclear if consistent with SM or new dynamics in charm decays

\* An aside : The  $A_{CP}$ 's are time-integrated, but contributions from the time-dependent CP violation for charm mixing have been subtracted in  $a_{K^-K^+}^d$  and  $a_{\pi^- \pi^+}^d$ .

NEW

# Charm mixing parameter $y_{CP} - y_{CP}^{K\pi}$

- Study the  $D^0$  meson decays into  $K^-K^+$ ,  $\pi^-\pi^+$  and  $K^-\pi^+$
- The decay  $D^0 \rightarrow K^-\pi^+$  is a CP-mixed state with  $\tau(D^0 \rightarrow K^-\pi^+) \approx 1/\Gamma$ ; the decay  $D^0 \rightarrow f$  is a CP-even state with  $\tau(D^0 \rightarrow f) < \tau(D^0 \rightarrow K^-\pi^+)$

$$f = KK, \pi\pi$$

- Measure ratio :

$$R^f(t) = \frac{N(D^0 \rightarrow f, t)}{N(D^0 \rightarrow K^-\pi^+, t)} \propto e^{-(y_{CP}^f - y_{CP}^{K\pi})t/\tau_{D^0}} \frac{\epsilon(f, t)}{\epsilon(K^-\pi^+, t)}$$

$$\approx -0.4 \times 10^{-3}$$

$$y_{CP}^{\pi\pi} - y_{CP}^{K\pi} = (6.57 \pm 0.53 \pm 0.16) \times 10^{-3}$$

$$y_{CP}^{KK} - y_{CP}^{K\pi} = (7.08 \pm 0.30 \pm 0.14) \times 10^{-3}$$

PRD 105 (2022) 092013

# $D^0$ mixing parameter $y_{CP} - y_{CP}^{K\pi}$

PRD 105 (2022) 092013

## ■ Measure ratio :

$$R^f(t) = \frac{N(D^0 \rightarrow f, t)}{N(D^0 \rightarrow K^-\pi^+, t)} \propto e^{-(y_{CP}^f - y_{CP}^{K\pi})t/\tau_{D^0}} \frac{\varepsilon(f, t)}{\varepsilon(K^-\pi^+, t)}$$

$f = KK, \pi\pi$

$$y_{CP}^{\pi\pi} - y_{CP}^{K\pi} = (6.57 \pm 0.53 \pm 0.16) \times 10^{-3}$$

$$y_{CP}^{KK} - y_{CP}^{K\pi} = (7.08 \pm 0.30 \pm 0.14) \times 10^{-3}$$

## ■ Combine :

$$y_{CP} - y_{CP}^{K\pi} = (6.96 \pm 0.26 \pm 0.13) \times 10^{-3}$$

This measurement is **four times** more precise than the previous world average value.

# New (exotic) spectroscopy measurements

Baryon

Meson

Tetraquark

Pentaquark

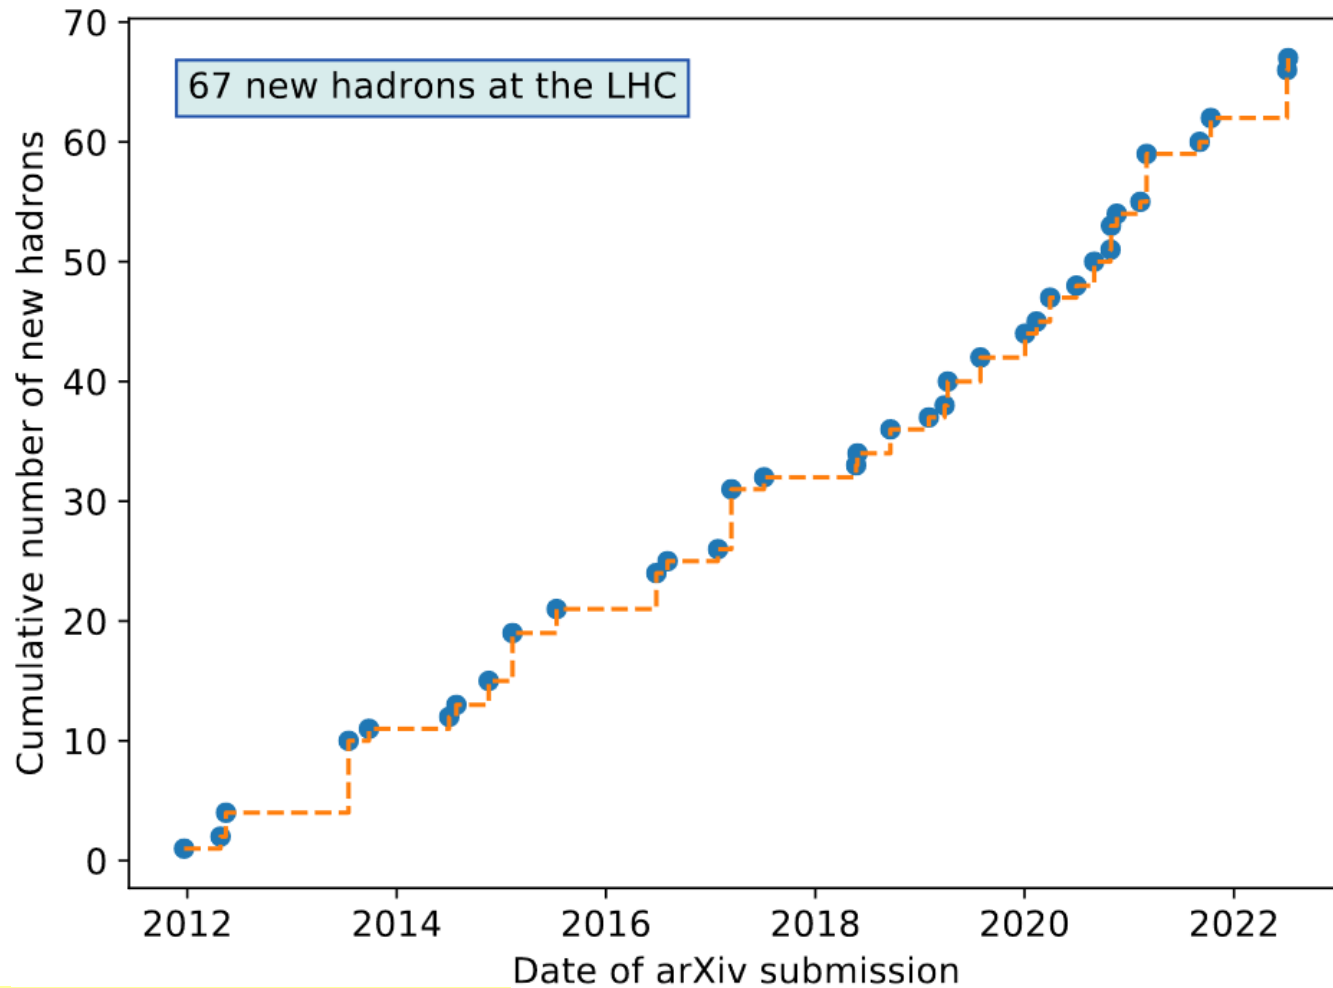

# Reminder: tetra/pentaquark discoveries

- Discovery of  $\chi_{c1}(3872)$  (formerly  $X(3872)$ ) by Belle in 2003 started new era in exotic spectroscopy
- First observation of  $P_c(4312)^+$ ,  $P_c(4440)^+$  and  $P_c(4457)^+$  by LHCb as narrow resonances in the mass spectrum of  $(J/\psi p)$  in  $\Lambda_b \rightarrow (J/\psi p) K^-$  decays PRL 115 (2015) 072001, PRL 122 (2019) 222001
- Consistent with  $c\bar{c}uud$  pentaquarks : allowed by QCD, but not observed in 50 years of searching.

# New hadron discoveries at the LHC

With thanks to Patrick Koppenburg  
LHCb-FIGURE-2021-001 (update)

# New hadron discoveries at LHCb

With thanks to Patrick Koppenburg  
LHCb-FIGURE-2021-001 (update)

# Need for a new naming scheme (proposal)

T.Gershon/LHCb : arXiv:2206.15233

■ Currently no PDG rule for :

- ◆ exotic mesons with s, c, b quantum numbers
- ◆ no extension for pentaquark states

T states zero net S, C, B			T states non-zero net S, C, B				P states			
(P, G)	I = 0	I = 1	(P)	I = 0	I = 1/2	I = 1	I = 0	I = 1/2	I = 1	I = 3/2
(-, -)	$\omega$	$\pi$	(-)	$\eta$	$\tau$	$\pi$	$\Lambda$	$N$	$\Sigma$	$\Delta$
(-, +)	$\eta$	$\rho$	(+)	$f$	$\theta$	$a$				
(+, +)	$f$	$b$								
(+, -)	$h$	$a$								

■ Idea of the proposal :

- ◆ T for tetra, P for penta
- ◆ **Superscript:** based on existing symbols, to indicate isospin, parity and G-parity
- ◆ **Subscript:** heavy quark content

Minimal quark content	Current name	$I^{(G)}, J^{P(C)}$	Proposed name

# Observation of a $J/\psi\Lambda$ resonance in $B^- \rightarrow J/\psi\Lambda p$ decays

**NEW**

LHCb-PAPER-2022-031 (in preparation)

- Study of  $B^- \rightarrow J/\psi\Lambda\bar{p}$  decays
- Observe  $P_{\psi_s}^\Lambda(J/\psi\Lambda)$  pentaquark with strange quark content  $\bar{c}\bar{c}uds$  close to  $\Xi_c^+ D^-$  threshold (with  $>10\sigma$  significance)
- $m(P_{\psi_s}^\Lambda(J/\psi\Lambda)) = 4338.2 \pm 0.7 \pm 0.4$  MeV  
 $\Gamma(P_{\psi_s}^\Lambda(J/\psi\Lambda)) = 7.0 \pm 1.2 \pm 1.3$  MeV
- Spin  $1/2$  is assigned.  $J^P = 1/2^+$  preferred

This is the first observation of a strange pentaquark

# An interesting aside – B mass measurement

LHCb-PAPER-2022-031 (in preparation)

NEW

- Small Q-value  $\approx 128$  MeV.
- Resolution on  $m(J/\psi \Lambda \bar{p})$   $\sigma \approx 2$  MeV
- Leads to the most precise  $B^-$  mass measurement  
 $m(B^-) = 5279.44 \pm 0.05$  (stat)  $\pm 0.07$  (syst) MeV

# Nature of pentaquarks ?

Possible models describing the observed pentaquark states :

- Tightly bounded states?
- Meson-baryon molecules?

- Re-scattering effects?

- Molecular-state model likely favoured when bound mesons and baryons form narrow resonances just below mass thresholds
- More work needed

# Recent 4-quark states from LHCb

NEW

- Observation of isospin triplet  $[c\bar{s}u\bar{d}]$  4-quark states in  $D_s^+\pi^-$  mass spectrum in  $B^0 \rightarrow \bar{D}^0 D_s^+\pi^-$  and  $B^+ \rightarrow D^- D_s^+\pi^+$  decays

$$M = 2.908 \pm 0.011 \pm 0.020 \text{ GeV}$$

$$\Gamma = 0.136 \pm 0.023 \pm 0.011 \text{ GeV}$$

LHCb-PAPER-2022-026/027  
(in preparation)

$m(D_s^+\pi^-)$  well described by adding  $J^P=0^+$  tetraquark states  $T_{c\bar{s}0}^a(2900)^0$  and  $T_{c\bar{s}0}^a(2900)^{++}$  in both channels ( $7.5 \sigma$ )

# Rare decays and lepton universality

# Rare decays : why interesting

- In the SM, processes involving flavour changing neutral currents (FCNCs) are forbidden at tree level but can occur at loop level (penguin and box)

$b \rightarrow s \ell^+ \ell^-$   
transitions  
(BF  $10^{-6}$  to  $10^{-10}$ )

- New particles too heavy to be produced directly, can give sizeable effects when exchanged in a loop

- This “indirect” approach to New Physics searches is complementary to that of ATLAS/ CMS

$$B_{(s)} \rightarrow \mu^+ \mu^-$$

- Very suppressed loop decay in the SM
- CKM ( $|V_{ts}|^2$  for  $B_s$ ) and helicity suppressed  $\sim (m_\mu/m_b)^2$
- Theoretically “clean”  $\rightarrow$  4% prediction :

$$\mathcal{B}(B_s^0 \rightarrow \mu^+ \mu^-)_{\text{SM}} = (3.66 \pm 0.14) \times 10^{-9}$$

$$\mathcal{B}(B^0 \rightarrow \mu^+ \mu^-)_{\text{SM}} = (1.03 \pm 0.05) \times 10^{-10}$$

Bobeth et al. PRL 112 (2014) 101801  
Beneke et al. JHEP 10 (2019) 232

- NP theories can predict significantly higher values for the branching ratios
- Very clean experimental signature
- Also studied by ATLAS & CMS

# 35 years of effort !

# A needle in a haystack

PRL 120 (2018) 061801

# $B_{(s)} \rightarrow \mu^+ \mu^-$ latest result

Phys Rev D 105 (2022) 012010  
Phys. Rev. Lett. 128, 041801

$$\mathcal{B}(B_s^0 \rightarrow \mu^+ \mu^-) = (3.09^{+0.46}_{-0.43} \quad ^{+0.15}_{-0.11}) \times 10^{-9} \quad | \quad (10\sigma)$$

$$\mathcal{B}(B^0 \rightarrow \mu^+ \mu^-) = (1.20^{+0.83}_{-0.74} \pm 0.14) \times 10^{-10} \quad (< 2.6 \times 10^{-10} @ 95\%CL)$$

- $B_s^0 \rightarrow \mu^+ \mu^-$  found with significance  $> 10$  sigma
  - ◆ But no evidence yet for  $B^0 \rightarrow \mu^+ \mu^-$  (1.7 sigma)
- Result dominated by statistical uncertainty

■ Latest CMS results

$$\mathcal{B}(B_s^0 \rightarrow \mu^+ \mu^-) = [3.83^{+0.38}_{-0.36} \text{ (stat)} \quad ^{+0.19}_{-0.16} \text{ (syst)} \quad ^{+0.14}_{-0.13} (f_s/f_u)] \times 10^{-9}$$

$$\mathcal{B}(B^0 \rightarrow \mu^+ \mu^-) = [0.37^{+0.75}_{-0.67} \text{ (stat)} \quad ^{+0.08}_{-0.09} \text{ (syst)}] \times 10^{-10}$$

# $B_{(s)} \rightarrow \mu^+ \mu^-$ latest result and LHC combination

Phys Rev D 105 (2022) 012010

 ATLAS-CONF-2020-049

## LHCb

$$\mathcal{B}(B_s^0 \rightarrow \mu^+ \mu^-) = (3.09^{+0.46}_{-0.43} \quad ^{+0.15}_{-0.11}) \times 10^{-9} \quad (10\sigma)$$

$$\mathcal{B}(B^0 \rightarrow \mu^+ \mu^-) = (1.20^{+0.83}_{-0.74} \pm 0.14) \times 10^{-10}$$

Combination  
 2.1 $\sigma$  below  
 SM prediction

# Effective $B_S$ lifetime

Phys Rev D 105 (2022) 012010  
Phys. Rev. Lett. 128, 041801

- For  $B_S$  mesons, there is a sizeable difference between the decay widths  $\Delta\Gamma_S$  of the light and heavy mass eigenstates ( $\Delta\Gamma_S = 0.085 \pm 0.004 \text{ ps}^{-1}$ ) PDG

- In the SM, the  $B_S$  system evolves with the lifetime of the heavy mass eigenstate (since CP odd).

- Define the  $B_S^0 \rightarrow \mu^+\mu^-$  effective lifetime as

$$\tau_{\mu^+\mu^-} \equiv \frac{\int_0^\infty t \Gamma(B_S(t) \rightarrow \mu^+\mu^-) dt}{\int_0^\infty \Gamma(B_S(t) \rightarrow \mu^+\mu^-) dt}$$

- LHCb measure  $\tau_{\mu^+\mu^-}(B_S(t) \rightarrow \mu^+\mu^-) = (2.07 \pm 0.29 \pm 0.03) \text{ ps}$ .

SM values  $\tau_L = 1.423 \pm 0.005 \text{ ps}$  and  $\tau_H = 1.620 \pm 0.007 \text{ ps}$

Consistency at **2.2 $\sigma$**  and **1.5 $\sigma$**

# Search for $B_{(s)} \rightarrow e^+e^-$

## ■ Standard Model predicts :

Beneke et al. JHEP 10 (2019) 232

- ◆  $\mathcal{B}(B_s \rightarrow e^+e^-) = (8.60 \pm 0.36) \times 10^{-14}$
- ◆  $\mathcal{B}(B^0 \rightarrow e^+e^-) = (2.41 \pm 0.13) \times 10^{-15}$

## ■ CKM and helicity super-suppressed decay : out of reach from the experimental point of view

## ■ LHCb measurement based on Run I and partial Run 2 ( $4 \text{ fb}^{-1}$ ). $\mathcal{B}$ measured relative to $B^+ \rightarrow K^+ J/\psi (\rightarrow e^+e^-)$

- ◆  $\mathcal{B}(B_s \rightarrow e^+e^-) < 9.4 \times 10^{-9} @ 90\%CL$
- ◆  $\mathcal{B}(B^0 \rightarrow e^+e^-) < 2.5 \times 10^{-9} @ 90\%CL$

PRL 124 (2020) 211802

# $b \rightarrow s \ell^+ \ell^-$ transitions

- Study  $B \rightarrow h \mu^+ \mu^-$  transitions with hadron  $h = K, K^*, \phi \dots$
- Same loop diagrams, different spectator quarks
- Rates, angular distributions and asymmetries are sensitive to NP
- A lot of phenomenological work invested in defining observables with “clean” theoretical predictions.

# $B^0 \rightarrow K^{*0} \mu^+ \mu^-$ : 4-body angular observables

- The  $B^0 \rightarrow K^{*0} \mu^+ \mu^-$  differential decay rate can be described by 3 angles and di-muon invariant mass squared ( $q^2$ )
- Rich structure of physics observables in the angular coefficients (as functions of  $q^2$ )
- Form angular coefficients which are robust against form-factor uncertainties (e.g.  $P'_5$ )

Descotes-Genon et al., JHEP 01 (2013) 048

$$\frac{1}{\Gamma} \frac{d^3(\Gamma + \Gamma)}{d \cos \theta_\ell d \cos \theta_K d\phi} = \frac{9}{32\pi} \left[ \frac{3}{4}(1 - F_L) \sin^2 \theta_K + F_L \cos^2 \theta_K + \frac{1}{4}(1 - F_L) \sin^2 \theta_K \cos 2\theta_\ell \right. \\ \left. - F_L \cos^2 \theta_K \cos 2\theta_\ell + S_3 \sin^2 \theta_K \sin^2 \theta_\ell \cos 2\phi + S_4 \sin 2\theta_K \sin 2\theta_\ell \cos \phi + \right. \\ \left. \sqrt{F_L(1 - F_L)} P'_5 \sin 2\theta_K \sin \theta_\ell \cos \phi + \frac{4}{3} A_{FB} \sin^2 \theta_K \cos \theta_\ell + S_7 \sin 2\theta_K \sin \theta_\ell \sin \phi + \right. \\ \left. S_8 \sin 2\theta_K \sin 2\theta_\ell \sin \phi + S_9 \sin^2 \theta_K \sin^2 \theta_\ell \sin 2\phi \right]$$

# Measurement of $P'_5$ angular coefficient

- Anomaly in  $P'_5$  found in  $B^0 \rightarrow K^{*0} \mu^+ \mu^-$  for  $4 < q^2 < 8 \text{ GeV}^2$
- $P'_5$  local tension of  $2.5\sigma$  and  $2.9\sigma$  in  $q^2$  bins of  $[4.0, 6.0]$  and  $[6.0, 8.0] \text{ GeV}^2$   
→ Global analysis finds a deviation of  $3.3\sigma$
- Also observed also in  $B^+$  isospin partner decay
- Some deviation from SM predictions also in other angular observables
- Results are intriguing, however extent of hadronic contributions still matter of debate (particularly regarding charm-quark loops)

$B^0 \rightarrow K^{*0} \mu^+ \mu^-$

PRL 125 (2020) 011802

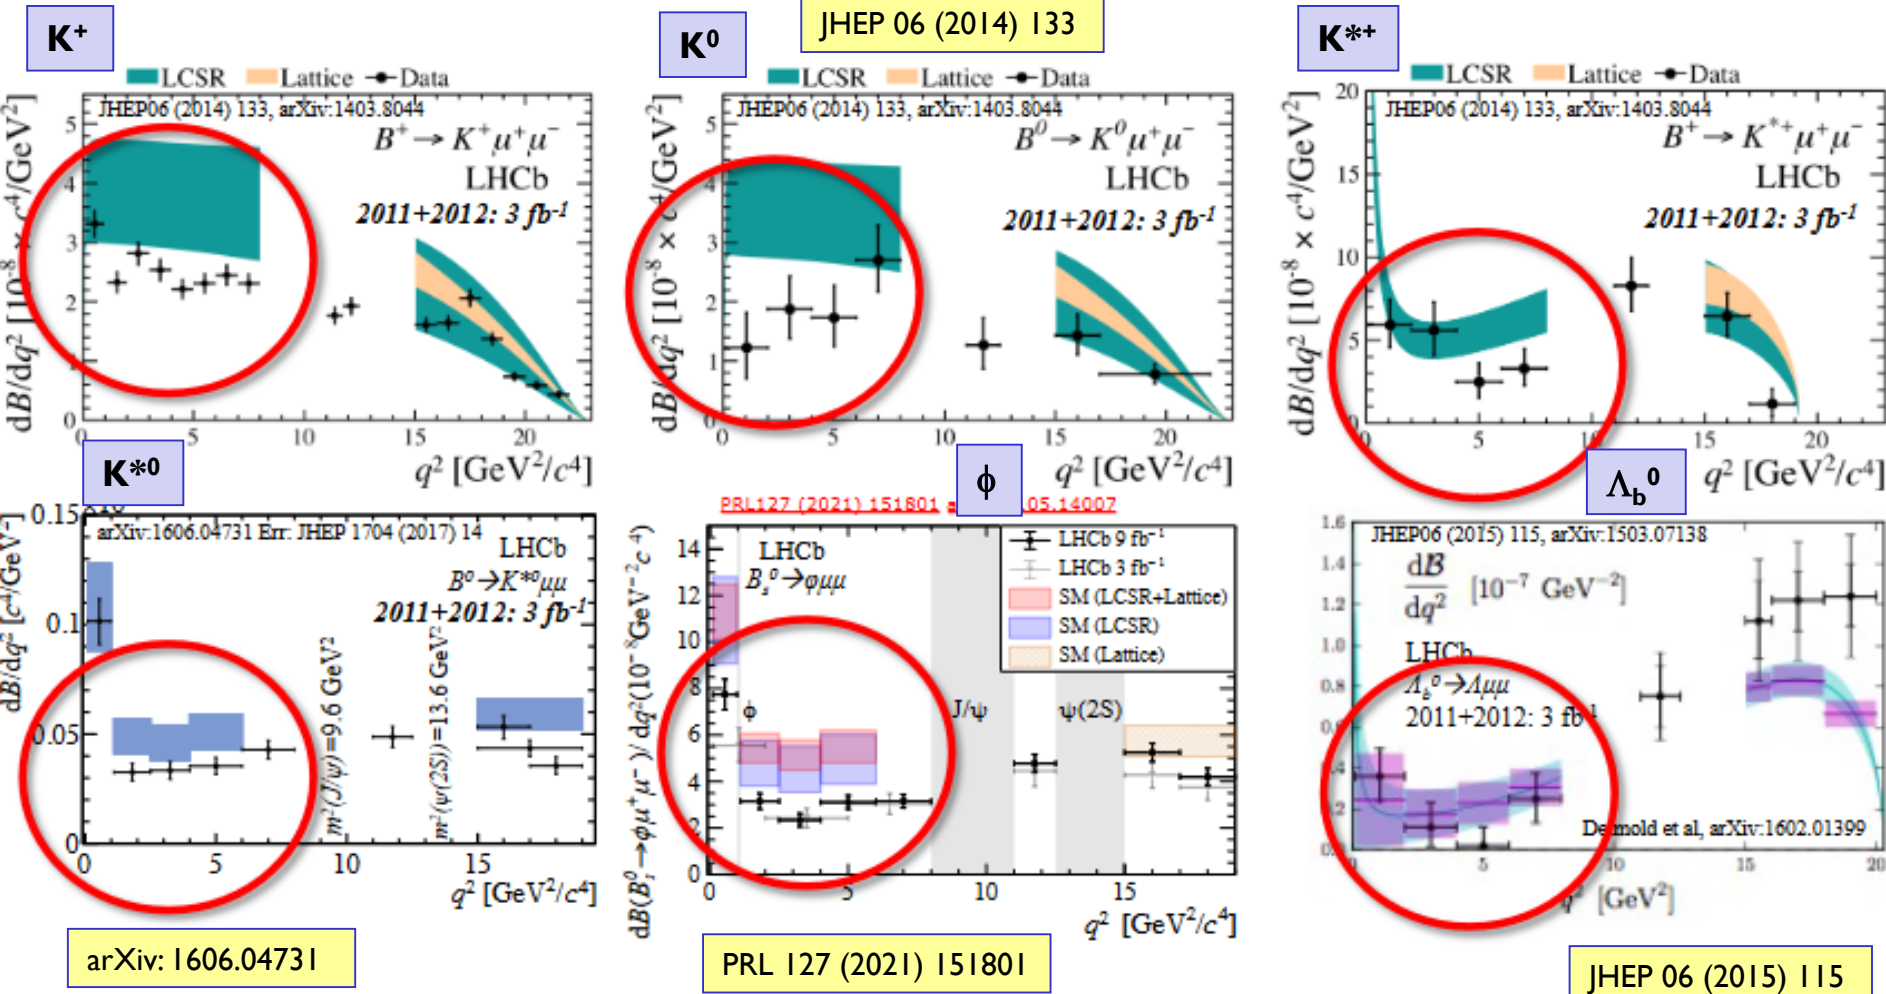

$B^+ \rightarrow K^{*+} \mu^+ \mu^-$

PRL 126 (2021) 161802

# Semi-leptonic differential branching fractions

- All semi-leptonic BF's lower than SM expectations at low  $q^2$  ( $\sim 1$  to  $4\sigma$ ) [comparison limited due to large theory uncertainties from form factors]

# Lepton Flavour Universality (LFU)

- LFU is a cornerstone of the SM : charged leptons ( $e, \mu, \tau$ ) couple in a universal way to the SM gauge bosons
- If NP couples in a non-universal way to the three lepton families, then we might see differences in rates of rare decays involving different lepton pairs (e.g.  $e/\mu$  or  $\mu/\tau$ )
- Hence - LFU is tested in  $b \rightarrow s \ell^+ \ell^-$  transitions. These are FCNC's with amplitudes involving loop diagrams

# Several R-ratio measurements

- Compare the rates of  $B \rightarrow X_s e^+ e^-$  and  $B \rightarrow X_s \mu^+ \mu^-$   
[where  $B$  is  $B^+$ ,  $B^0$ ,  $B_s^0$ ,  $\Lambda_b^0$  and  $X_s$  is  $K^+$ ,  $K^{*0}$ ,  $\phi$ ,  $pK \dots$ ]
- This allows precise testing of lepton flavour universality
- We can construct the ratio :

$$R_X = \frac{\int_{q_{\min}^2}^{q_{\max}^2} \frac{d\mathcal{B}(B_q \rightarrow X_s \mu^+ \mu^-)}{dq^2} dq^2}{\int_{q_{\min}^2}^{q_{\max}^2} \frac{d\mathcal{B}(B_q \rightarrow X_s e^+ e^-)}{dq^2} dq^2} = 1 \pm \mathcal{O}(1\%)$$

- Small theoretical uncertainties because hadronic uncertainties cancel
- This ratio is unity in the SM, neglecting lepton masses, with QED corrections at the % level

- Five different ratios published so far by LHCb:  
 $X_s = K^+$ ,  $K_s^0$ ,  $K^{*0}$ ,  $K^{*+}$  and  $pK^-$

# This might seem easy, but actually rather challenging

- Lower efficiency of electron trigger
- Electrons emit bremsstrahlung, resulting in degraded momentum and mass resolution
- Attempt to recover the energy of the emitted photons :
  - ◆ Some energy missed
  - ◆ Some energy mis-attributed

Nat Phys 18 (2022) 277

# Experimental strategy

- Actually measure double ratios which significantly reduce systematic uncertainties:

$$R_X = \frac{\mathcal{B}(B_q \rightarrow X_s \mu^+ \mu^-)}{\mathcal{B}(B_q \rightarrow X_s J/\psi(\mu^+ \mu^-))} \cdot \frac{\mathcal{B}(B_q \rightarrow X_s J/\psi(e^+ e^-))}{\mathcal{B}(B_q \rightarrow X_s e^+ e^-)}$$

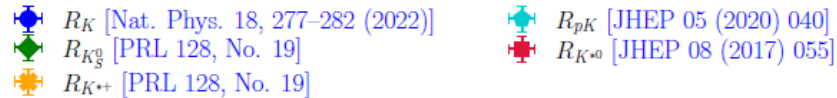

- Ratios determined using yields and efficiencies
  - ◆ Yields extracted from fits to the data
  - ◆ As cross-checks the ratios

$$R_{J/\psi} = \frac{\mathcal{B}(B_q \rightarrow X_s J/\psi(\mu^+ \mu^-))}{\mathcal{B}(B_q \rightarrow X_s J/\psi(e^+ e^-))}$$

are compatible with unity to 0.4%

$X_s$	$\Gamma_{J/\psi}$	$R_{\psi(2S)}$
$K^+$	$0.981 \pm 0.020$	$0.997 \pm 0.011$
$K^{*+}$	$0.965 \pm 0.032$	$1.017 \pm 0.050$
$K_s^0$	$0.977 \pm 0.028$	$1.014 \pm 0.036$
$K^0$	$1.043 \pm 0.045$	within $1\sigma$ from 1
$pK^-$	$0.96 \pm 0.05$	within $1\sigma$ from 1

# LFU results : $R_x$

$R_K$  (9/fb) 3.1  $\sigma$  from SM

$R_{K^{*+}}$  (9/fb) 1.4  $\sigma$  **NEW**

$R_{K_S^0}$  (9/fb) 1.5  $\sigma$  **NEW**

$R_{K^{*0}}$  low- $q^2$  (3/fb) 2.1  $\sigma$

$R_{K^{*0}}$  central- $q^2$  (3/fb) 2.4  $\sigma$

$R_{pK}$  (5/fb)  $< 1 \sigma$

- All measurements have values less than unity
- The puzzle persists → we eagerly await Belle-II & CMS results
- LHCb is now focused on completing a combined analysis of  $R_K$  &  $R_{K^*}$  with the Run I+2 dataset. This work has led to a deeper understanding of systematics which will be reflected in the final result.

# LFU studies in $B^0 \rightarrow D^{(*)-} \tau^+ \nu_\tau$ decays

- Different class of decays (**tree-level** charged current with  $V_{cb}$  suppression)
- Not at all rare:  $B(B^0 \rightarrow D^{*-} \tau^+ \nu_\tau) \sim 1\%$ , the problem is the background.
- Lepton-universality ratio  $R(D^*)$ :

$$R(D^*) = \frac{B(B^0 \rightarrow D^{*-} \tau^+ \nu_\tau)}{B(B^0 \rightarrow D^{*-} \mu^+ \nu_\mu)}$$

- may be sensitive to any NP model coupling preferentially to third generation leptons

- Ratios predicted theoretically at  $\sim 1\%$ :

$$R(D)_{\text{SM}} = 0.299 \pm 0.003$$

$$R(D^*)_{\text{SM}} = 0.258 \pm 0.005$$

HFLAV 2019 average  
of theoretical  
predictions

- Anomalies first observed by Belle and BaBar

# $R(D)$ vs $R(D^*)$

- All experiments see an excess wrt SM predictions
- Combining  $R(D)/R(D^*)$  average  $\sim 3.4 \sigma$  tension with SM

- Intriguing as anomaly occurs in a tree-level SM process
- New LHCb result

$$R(\mathcal{A}_c) = 0.242 \pm 0.026 \pm 0.040 \pm 0.059(\text{ext})$$

arxiv:2201:03497

Measurement is consistent with SM ( $\sim 1 \sigma$  “low”) [SM= $0.324 \pm 0.004$ ].

LHCb Upgrade I  
2025 ( $\sim 23 \text{ fb}^{-1}$ )

LHCb Upgrade II  
2035 ( $300 \text{ fb}^{-1}$ )

# Summary and Outlook

- The LHCb experiment has performed spectacularly well :  
→  $\sim 9 \text{ fb}^{-1}$  of recorded data up to  $\sqrt{s} = 13 \text{ TeV}$
- So far all Unitarity Triangle measurements are consistent with the Standard Model  
→ New Physics is becoming constrained
- LHCb is a fantastic platform for spectroscopy measurements: many measurements were never foreseen in LHCb's original physics portfolio. We now even need a new naming system !
- Many rare-decay results show good compatibility with the SM, however hints of LFU violation persist. This has generated a lot of theoretical interest. We eagerly await confirmation ...
- Still a lot of room for New Physics, but higher precision required  
→ preparing for LHCb Upgrades beyond 2022 and the decade afterwards! Very much looking forward to Belle-II results.

# LHCb measurement of $\sin(2\beta)$

$\sin(2\beta)$  from  $B^0 \rightarrow J/\psi K_S^0$  and  $B^0 \rightarrow \psi(2S)K_S^0$

JHEP 11 (2017) 170

$$A_{[c\bar{c}]K_S^0}(t) \equiv \frac{\Gamma(\bar{B}^0(t) \rightarrow [c\bar{c}]K_S^0) - \Gamma(B^0(t) \rightarrow [c\bar{c}]K_S^0)}{\Gamma(\bar{B}^0(t) \rightarrow [c\bar{c}]K_S^0) + \Gamma(B^0(t) \rightarrow [c\bar{c}]K_S^0)} \approx S \sin(\Delta m t) - C \cos(\Delta m t)$$

where  $S = \sin(2\beta)$  assuming  $C_{J/\psi K_S} (\equiv \text{penguin contribution}) = 0$

$$C(B^0 \rightarrow [c\bar{c}]K_S^0) = -0.017 \pm 0.029$$

$$S(B^0 \rightarrow [c\bar{c}]K_S^0) = 0.760 \pm 0.034$$

Competitive with Babar & Belle.  
HFLAV world average from all modes :  
 $\sin(2\beta) = 0.695 \pm 0.019$

# LHCb measurement of $|V_{ub}|$

- $|V_{ub}| / |V_{cb}|$  difficult at hadron colliders due to presence of neutrino
- LHCb measures  $\Lambda_b \rightarrow p \mu^- \nu$  (the  $B^0 \rightarrow \pi^- \mu^+ \nu$  channel is extremely difficult)
- The measurement relies on  $\Lambda_b \rightarrow p$  form factors from the lattice)

$$|V_{ub}| = (3.27 \pm 0.15(\text{exp}) \pm 0.17(\text{theory}) \pm 0.06 (|V_{cb}|)) \times 10^{-3}$$

Nature Physics 10 (2015) 1038

# Several methods to measure $\gamma$

- From  $B^\pm$  (and  $\bar{B}^0$ ) decays : the “time-integrated”, direct CP-violation modes  $B^\pm \rightarrow \bar{D}^0 K^\pm$

- GLW

Gronau & London, PLB 253 (1991) 483,  
Gronau & Wyler PLB 265 (1991) 172

- ADS

Atwood, Dunietz & Soni PRL 78 (1997) 3257,  
Atwood, Dunietz & Soni PRD 63 (2001) 036005

- GGSZ

Giri, Gronau, Soffer & Zupan, PRD 68 (2003) 054018

- $B_s^0 \rightarrow D_s K$  time-dependent (TD) analysis

Dunietz & Sachs Phys. Rev. D37(1988) 3186,  
R. Aleksan, I. Dunietz & B. Kayser, Z. Phys. C54 (1992) 653

# “GLW” method

- Method where  $D^0$  and  $\overline{D}^0$  decay to CP eigenstates
- Eigenstates are equally accessible to  $D^0$  and  $\overline{D}^0$
- Only 2 hadronic parameters  $r_B, \delta_B$  to be determined alongside  $\gamma$  ( $r_B \sim 0.1$ )

“Counting experiment” : observe the rate of  $B^-$  vs.  $B^+$  decays

Weak phase changes sign for equiv  $B^+$  diagram, thickness of arrows indicate relative strengths

$$\frac{N(B^-) - N(B^+)}{N(B^-) + N(B^+)} = A_{CP^+} = \frac{1}{R_{CP^+}} 2r_B (2F_+ - 1) \sin(\delta_B) \sin(\gamma)$$

$$\frac{N(B \rightarrow [KK]_D K) \times \Gamma(D \rightarrow K\pi)}{N(B \rightarrow [K\pi]_D K) \times \Gamma(D \rightarrow KK)} = R_{CP^+} = 1 + r_B^2 + 2r_B (2F_+ - 1) \cos(\delta_B) \cos(\gamma)$$

For CP+ eigenstates e.g KK,  $\pi\pi$ ,  $F_+ = 1$

# “ADS” method

Weak phase changes sign for equivalent  $B^+$  diagram

$$\frac{N(B^-) - N(B^+)}{N(B^-) + N(B^+)} = A_{ADS} = \frac{1}{R_{ADS}} 2r_B r_D \sin(\delta_B + \delta_D) \sin(\gamma)$$

$$\frac{N(B^\pm \rightarrow [\pi^\pm K^\mp]_D K^\pm)}{N(B^\pm \rightarrow [K^\pm \pi^\mp]_D K^\pm)} = R_{ADS} = r_B^2 + r_D^2 + 2r_B r_D \cos(\delta_B + \delta_D) \cos(\gamma)$$

Again, a counting experiment : observing the rate of  $B^-$  vs.  $B^+$  decays

- Decay into flavour-specific final states
- Larger interference effects than for GLW as both amplitudes of similar sizes.
- $r_B, \delta_B$  hadronic parameters again to be determined alongside  $\gamma$  ( $r_B \sim 0.1$ )
- Additional two parameters  $r_D, \delta_D$ . External inputs from charm mixing measurements ( $r_D \sim 0.06$ )

# “GGSZ” method

- 3-body final D states  
e.g.  $D \rightarrow K_S^0 \pi \pi$

- Dalitz plot analysis :  
a counting experiment  
in bins of phase space,  
where  $r_D$  and  $\delta_D$  vary

Weak phase changes sign for equiv  $B^+$  diagram

- GGSZ observables (rate as function of Dalitz position)

$$d\Gamma_{B^\pm}(x) = A_{(\pm, \mp)}^2 + r_B^2 A_{(\mp, \pm)}^2 + 2A_{(\pm, \mp)} A_{(\mp, \pm)} \left[ \underbrace{r_B \cos(\delta_B \pm \gamma)}_{x_\pm} \underbrace{\cos(\delta_{D(\pm, \mp)})}_{c_i} + \underbrace{r_B \sin(\delta_B \pm \gamma)}_{y_\pm} \underbrace{\sin(\delta_{D(\pm, \mp)})}_{s_i} \right]$$

$c_i$  and  $s_i$  measured from Q-C D decays at CLEO-c

arXiv:1010.2817

# New GLW & ADS $\gamma$ measurements

GLW : where  $D^0$  and  $\overline{D}^0$  decay to CP eigenstates

ADS : where  $D^0$  and  $\overline{D}^0$  decay to flavour-specific states

$$A_K^{CP} = \frac{\Gamma(B^- \rightarrow [hh]_D^0 K^-) - \Gamma(B^+ \rightarrow [hh]_D^0 K^+)}{\Gamma(B^- \rightarrow [hh]_D^0 K^-) + \Gamma(B^+ \rightarrow [hh]_D^0 K^+)}$$

JHEP 04 (2021) 081

# Charm CPV : more recent measurements

- Direct CPV :  $A_{CP}(D^0 \rightarrow K_S^0 K_S^0)$  arXiv:2105.01565 (2021)
- Use  $D^0 \rightarrow K^+ K^-$  channel as control for  $A_D$  &  $A_P$
- $A_{CP} = (-3.1 \pm 1.2 \pm 0.4 \pm 0.2)\%$  [last uncertainty : CP violation of control channel]
- Consistent with no violation at the  $2.4\sigma$  level

# $A_{CP}(D^+ (s) \rightarrow h^+ \pi^0, h^+ \eta)$

JHEP 06 (2021) 019

$$\begin{aligned} \mathcal{A}_{CP}(D^+ \rightarrow \pi^+ \pi^0) &= (-1.3 \pm 0.9 \pm 0.6) \%, \\ \mathcal{A}_{CP}(D^+ \rightarrow K^+ \pi^0) &= (-3.2 \pm 4.7 \pm 2.1) \%, \\ \mathcal{A}_{CP}(D^+ \rightarrow \pi^+ \eta) &= (-0.2 \pm 0.8 \pm 0.4) \%, \\ \mathcal{A}_{CP}(D^+ \rightarrow K^+ \eta) &= (-6 \pm 10 \pm 4) \%, \\ \mathcal{A}_{CP}(D_s^+ \rightarrow K^+ \pi^0) &= (-0.8 \pm 3.9 \pm 1.2) \%, \\ \mathcal{A}_{CP}(D_s^+ \rightarrow \pi^+ \eta) &= (0.8 \pm 0.7 \pm 0.5) \%, \\ \mathcal{A}_{CP}(D_s^+ \rightarrow K^+ \eta) &= (0.9 \pm 3.7 \pm 1.1) \%, \end{aligned}$$

- All compatible with no CP violation
- More data needed !
- Note that LHCb is now regularly extracting measurements with neutrals in the final state ( $K_s K_s$  and  $h^0 h^+$ )

# $\Delta Y$ in $D^0 \rightarrow K^+K^-$ and $D^0 \rightarrow \pi^+\pi^-$ decays

arXiv:2105.09889

- $\Delta Y$  is the slope of the time-dependent asymmetry of the decay rates of  $D^0$  and  $\bar{D}^0$  mesons
- It is a measure of **CP violation in mixing and interference**
- Strategy: measure asymmetry in bins of decay time and measure the linear slope

$$\Delta Y_{K^+K^-} = (-2.3 \pm 1.5 \pm 0.3) \times 10^{-4}$$

$$\Delta Y_{\pi^+\pi^-} = (-4.0 \pm 2.8 \pm 0.4) \times 10^{-4}$$

Combining

$$\Delta Y = (-2.7 \pm 1.3 \pm 0.3) \times 10^{-4}$$

- Compatible with 0 within  $2\sigma$
- This result improves by nearly a factor 2 the precision of the previous world average

# $D^0$ mixing parameters in $D^0 \rightarrow K_S^0 \pi^+ \pi^-$

- Mass eigenstates  $|D_{1,2}\rangle = p|D^0\rangle \pm q|\overline{D}^0\rangle$
- $x = (m_1 - m_2)/\Gamma$  ;  $y = (\Gamma_1 - \Gamma_2)/2\Gamma$ ,  $\phi = \arg(q/p)$   
until now  $x$  measured only at  $\sim 3\sigma$  (HFLAV)
- $30.6 \times 10^6$  of  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$  decays with very small background.  $\overline{D}$  or  $D$  flavour tagging using  $D^* \rightarrow D \pi$  decays
- Use the bin-flip method
  - ◆ Measure ratios between  $D^0$  and  $\overline{D}^0$  candidates in symmetric bins of Dalitz plot  $m^2(K_S^0 \pi^-)$  vs  $m^2(K_S^0 \pi^+)$
  - ◆ 2 (flavour)  $\times$  16 (Dalitz bin)  $\times$  13 (decay time bin) subsamples
  - ◆ In each bin, strong-phase difference approx. constant for  $D^0$  and  $\overline{D}^0$  amplitudes (input from CLEOc and BESIII)

$$m_{\pm}^2 \equiv \begin{cases} m^2(K_S^0 \pi^{\pm}) & \text{for } D^0 \rightarrow K_S^0 \pi^+ \pi^- \\ m^2(K_S^0 \pi^{\mp}) & \text{for } \overline{D}^0 \rightarrow K_S^0 \pi^+ \pi^- \end{cases}$$

# $B_s \rightarrow J/\psi \phi$ analysis

Eur. Phys. J. C 79 (2019) 706

- $\phi$  is a vector meson (spin 1)
- Vector-vector final state: mixture of CP-odd and CP-even components

Need to perform time-dependent  $B_s \rightarrow J/\psi \phi$  angular analysis

- Good tagging performance of  $B_s$  &  $\overline{B}_s$  is important

Category	$\epsilon_{\text{tag}}(\%)$	$D^2$	$\epsilon_{\text{tag}}D^2(\%)$
OS only	11.4	0.078	$0.88 \pm 0.04$
SSK only	42.6	0.032	$1.38 \pm 0.30$
OS & SSK	23.8	0.104	$2.47 \pm 0.15$
Total	77.8	0.061	$4.73 \pm 0.34$

# B<sub>s</sub> → J/ψ φ: fit projections

Eur. Phys. J. C 79 (2019) 706

# $B_s$ weak mixing phase $\phi_s$ in $B_s \rightarrow J/\psi \phi$

- “Golden mode” for this study is  $B_s \rightarrow J/\psi \phi$  ( $\rightarrow K^+K^-$ )
- Analogue of  $2\beta$  (phase of  $B^0$  mixing) but in the  $B_s$  system
- Interference between  $B^0$  decay to  $J/\psi \phi$  directly and via  $B^0 - \bar{B}^0$  oscillation gives rise to a CP violating phase in the SM : a time-dependent measurement
 
$$\phi_S = \phi_{\text{Mixing}} - 2 \phi_{\text{Decay}} = -2\beta_s$$
- $\phi_S$  is expected to be very small in the SM and precisely predicted:
 
$$\phi_{\text{SM}} = -0.037 \pm 0.001 \text{ rad} \quad (\text{see eg Charles et al PRD84 (2011) 033005})$$

- $\phi_S$  fitted value correlated with  $\Delta\Gamma_S =$  width diff. of the  $B_S$  mass eigenstates  $\rightarrow$  plot as contours in  $(\phi_S \text{ vs } \Delta\Gamma_S)$  plane
- $\phi_S$  is  $0.1\sigma$  from Standard Model and  $1.6\sigma$  from zero

$$\Delta\Gamma_S = 0.0813 \pm 0.0048 \text{ ps}^{-1}$$

$$\text{CP-violating phase: } \phi_S = -0.040 \pm 0.025 \text{ rad}$$

# HFLAV combination all experiments

CP-violating phase:

$$\phi_S = -0.050 \pm 0.019 \text{ rad}$$

$$(\phi_S^{\text{SM}} = -0.037 \pm 0.001 \text{ rad})$$

# Measurement of CP violation in $B_s \rightarrow \phi\phi$

LHCb-PAPER-2019-019

- Enhanced sensitivity to NP since decay is dominated by penguin loop
- SM prediction of CP violating phase is small  $< 20$  mrad

arXiv:0810.0249  
Phys.Rev.D80:114026,2009

- Perform time-dependent angular analysis, Run I data  $2 \text{ fb}^{-1}$  Run 2
- $|\Phi_{\text{SSS}}| = -73 \pm 115 \pm 27$  mrad

# New hadron discoveries at the LHC

With thanks to Patrick Koppenburg

# Evidence for more pentaquark states

- Amplitude analysis using 800  $B_s^0 \rightarrow J/\psi p \bar{p}$  decays
- Observe additional structure in  $J/\psi p$  and  $J/\psi \bar{p}$  spectra
- Significance of  $3.1\sigma$  to  $3.7\sigma$  depending on  $J^P$  assignment
- Evidence for new  $P_c(4337)^+$  state consistent with another  $(cc\bar{u}ud)$  pentaquark
- Amplitude analysis using 1750  $\Xi_b^- \rightarrow J/\psi \Lambda K^-$  decays
- Observe structure in  $J/\psi \Lambda$  spectrum
- Evidence for new  $P_{cs}(4459)^0$  state with significance of  $3.1\sigma$
- Consistent with  $(cc\bar{u}uds)$  pentaquark

arXiv:2108.04720

	$M[\text{MeV}]$	$\Gamma[\text{MeV}]$
$P_c(4337)^+$	$4337_{-4}^{+7} \pm 2$	$29_{-12}^{+26} \pm 14$
$P_{cs}(4459)^0$	$4458.8 \pm 2.9_{-1.1}^{+4.7}$	$17.3 \pm 6.5_{-5.7}^{+8.0}$

Sci.Bull.66(2021)1278

# New doubly charmed tetraquark $T_{cc}^+$

- Study  $D^0 D^0 \pi^+$  mass spectrum near  $D^{*+}D^0$  and  $D^{*0}D^+$  thresholds

$$\delta m \equiv m_{T_{cc}^+} - (m_{D^{*+}} + m_{D^0})$$

- Very narrow state in  $D^0 D^0 \pi^+$  mass spectrum consistent with  $ccu\bar{d}$  tetraquark, with significance  $10\sigma$ . Manifestly exotic state.

- Very close to  $D^{*+}D^0$  mass thresholds

$$\delta m_{BW} = -273 \pm 61 \text{ keV}/c^2$$

$$\Gamma_{BW} = 410 \pm 165 \text{ keV}$$

- Possible evidence for molecular bound state, but jury still out.

# More observations of new tetraquark states

- $B^+ \rightarrow J/\psi \phi K^+$  sample
- Observe structure in  $J/\psi K$
- Observation of two new  $c \bar{c} u \bar{s}$  tetraquark states  $Z_{cs}(4000)^+$  and  $Z_{cs}(4220)^+$
- Significance of  $15\sigma$  and  $6\sigma$  respectively,  $I^+$  assignment

Phys. Rev. Lett. 127 (2021) 082001

$Z_{cs}(4000)$	15 (16)	$4003 \pm 6^{+4}_{-14}$	$131 \pm 15 \pm 26$
$Z_{cs}(4220)$	5.9 (8.4)	$4216 \pm 24^{+43}_{-30}$	$233 \pm 52^{+97}_{-73}$

- $B^+ \rightarrow J/\psi \phi K^+$  sample
- Observe structure in  $J/\psi \phi$
- Observation of two new  $c \bar{c} s \bar{s}$  tetraquark states  $X(4630)$  and  $X(4685)$  as well as previously confirmed states
- Significance of  $5.5\sigma$  and  $15\sigma$  respectively

$X(4630)$	5.5 (5.7)	$4626 \pm 16^{+18}_{-11n}$	$174 \pm 27^{+134}_{-73}$
$X(4685)$	15 (15)	$4684 \pm 7^{+13}_{-16}$	$126 \pm 15^{+37}_{-41}$

# Latest 4-quark states from LHCb

- Observation of  $X(3960)$  in  $D_s^+D_s^-$  mass spectrum near threshold Quark content:  $[c\bar{c}s\bar{s}]$
- Question whether  $X(3960)$  could be the  $X_{c0}(3930)$  ?
- Determination of the properties needs more work

LHCb-PAPER-2022-026 (in preparation)  
LHCb-PAPER-2022-027 (in preparation)

$$M_0 = 3955 \pm 6 \pm 11 \text{ MeV}$$

$$\Gamma_0 = 48 \pm 17 \pm 10 \text{ MeV}$$
