# Taming the little SUSY hierarchy with the quiver supersymmetric standard model

### Ken-ichi Okumura Iwate Medical University

KO, JPS meeting March 2022 KO, Planck2023 June 2023

KO in progress

# Introduction

- SUSY Standard Model looks suffering from the little hierarchy problem.
  - EW symmetry breaking (100 GeV) vs SUSY breaking (gluino 2 TeV, stop 1 TeV over)
  - fine-tuning of O(0.1) %
- Any attempt realizing natural multi-TeV supersymmetry would be welcome for future LHC run/FCC
- <u>We propose Quiver Supersymmetric Standard</u> <u>Model + "Sliding 3<sup>rd</sup> Generation"</u>

# Little SUSY hierarchy problem

Even a RG scale ambiguity can generates a few hundred GeV correction!

# Little SUSY hierarchy problem

Lesson:

The Higgs field should not touch the SUSY breaking via gauge and Yukawa interactions until just before the gaugino, squark and slepton decouple.

$$\delta m_{H_u}^2 = \frac{1}{16\pi^2} \left[ -6g_2^2 |M_2|^2 - \frac{6}{5}g_1^2 |M_1|^2 + \frac{3}{5}g_1^2 S + \frac{6|y_t|^2}{(m_{H_u}^2 + m_{Q_3}^2 + m_{\overline{U}_3}^2 + |A_t|^2)} \right] \ln\left(\frac{Q}{M}\right)$$

### Stop mass

#### It's not easy to lift the stop mass to multi-TeV

The SM top Yukawa is fixed and a small mixing hits the Landau pole SUSY breaking by the singlet F term generates mixing with  $\overline{Q}^*$  and reduce the stop mass.

### EW symmetry breaking (Tree-level)

### Effective potential and Tadpole

$$\begin{aligned} V_{eff} &= \frac{1}{64\pi^2} Str M^4 \left( \ln \left( \frac{M^2}{Q_{\text{renorm}}^2} \right) - \frac{3}{2} \right) \\ T_{u,d} &= -\frac{\partial V_{eff}}{\partial H_{u,d}} \\ H_{u,d} &= -\frac{M^2}{2} \int \Phi \\ \frac{1}{2} m_Z^2 &= -|\mu|^2 - \frac{(m_{H_d}^2 - T_d/v_d) - (m_{H_u} - T_u/v_u) \tan^2 \beta}{1 - \tan^2 \beta} \\ &\approx T_u/v_u - m_{H_u}^2 - |\mu|^2 + \frac{m_{H_d}^2}{\tan^2 \beta} \end{aligned}$$

### Effective potential and tadpole

$$\begin{split} T_{u,d} &= -\frac{\partial V_{eff}}{\partial H_{u,d}} \\ &= -\frac{1}{32\pi^2} \sum_{i} (-)^{2S_i} \frac{\partial \hat{M}_i^2}{\partial H_{u,d}} \hat{M}^2{}_i \left( \ln\left(\frac{\hat{M}_i^2}{Q_{\text{renorm}}^2}\right) - 1 \right) \\ & \frac{\partial \hat{M}_i^2}{\partial H_{u,d}} = \frac{\partial}{\partial H_{u,d}} \left( UMU^{\dagger} \right)_{ii} \\ &= \left( U \frac{\partial M}{\partial H_{u,d}} U^{\dagger} \right)_{ii} \end{split}$$

### **Neutralino Mass**

SU(2) Gaugino Bifundamental  $\chi_L^- = \begin{bmatrix} \lambda_L^{A-}, & \lambda_L^{B-}, & \tilde{G}_L^-, & \tilde{H}_d^- \end{bmatrix}$  $\chi_B^- = \begin{bmatrix} \lambda_L^{A+c}, & \lambda_L^{B+c}, & \tilde{G}_L^{+c}, & \tilde{H}_u^{+c} \end{bmatrix}$ 

$$\begin{split} & \mathcal{Stop Mass} \\ \Psi_{\tilde{t}} = \left[ \begin{array}{ccc} Q', & \overline{Q}^{*}, & Q, & \overline{U}'^{*}, & U, & \overline{U}^{*} \end{array} \right] \\ & M_{\tilde{t}}^{2} = \left[ \begin{array}{ccc} m_{Q'}^{2} + \lambda_{Q}^{2} v_{X}^{2} & \lambda_{Q}(A_{Q}v_{X} & \mu_{Q}\lambda_{Q}v_{X} & \mu_{Q}\lambda_{Q}v_$$

### EW symmetry breaking (1-loop)

### Gaugino mass and tadpole

### Stop mass and tadpole

# Summary

- We analysed a model with a natural SUSY little hierarchy combining the quiver supersymmetric SM and sliding 3rd generation.
- We can obtain required bifundamental vaccums with a relatively simple superpotential.
- Landau poles and non-holomorphic mixing due to SUSY breaking appears to be obstacles to lift the stop mass to multi-TeV.
- Tadpoles due to the multi-TeV gaugino are small.
- Tadpoles due to the stop dominate the cause of fine-tuing (<~3-5%), a factor improvement could have a strong impact.

# Thank You
